

LECTURE 4

STEFANO BOVINO

UNIVERSIDAD DE CONCEPCIÓN

RELEVANT QUANTITIES IN ASTROCHEMICAL MODELS

- ▶ Collisions are fundamental: elastic, inelastic, and reactive processes regulate the ISM
- ▶ Astrochemical network contains thousands of reactions and hundreds of species (see KIDA)
- ▶ Knowledge of elementary reactions is required (only a few % have been studied at temperature of interest for the ISM)
- ▶ We need rate coefficients and branching ratios

COLLISIONS, CROSS SECTIONS, RATE COEFFICIENTS

Simple Collision Theory (classical): for a reaction to occur, the reactants must have:

- a sufficiently close encounter, or "collision" (→ **cross section** σ)
- a sufficient collision energy (→ **activation energy** E_{act})

Number of collisions per unit time and unit volume: $n_A n_B \sigma \langle v_{\text{rel}} \rangle$

For a Maxwellian velocity distribution:

- the average thermal speed is $\langle v_{\text{rel}} \rangle = \left(\frac{8k_B T}{\pi \mu} \right)^{1/2}$
- the fraction of particles with $E > E_{\text{act}}$ is $f(E > E_{\text{act}}) = \exp\left(-\frac{E_{\text{act}}}{k_B T}\right)$

Collision theory (Maxwell distribution)

Thermal Energy Distribution

As temperature increases, the fraction of molecules with enough energy to surmount the activation energy barrier also increases.

RATE COEFFICIENTS IN GAS-PHASE (THERMAL EQ)

unimolecular reactions: $A \rightarrow C$

$$k = \sigma v$$

$$-\frac{dn(A)}{dt} = k n(A) = \frac{dn(C)}{dt}$$

- ▶ The above formulation is valid if sigma is velocity-independent
- ▶ Normally: we have a distribution of speed

$$k(T) = \langle \sigma v \rangle = \int_0^{\infty} \sigma(v) v f(v) dv$$

RATE COEFFICIENTS IN GAS-PHASE (THERMAL EQ)

- ▶ This obeys a Maxwell-Boltzmann distribution

$$f(v)dv = 4\pi v^2 \left(\frac{\mu}{2\pi k_B T} \right)^{3/2} \exp\left(-\frac{\mu v^2}{2k_B T}\right) dv$$

$$k(T) = \langle \sigma v \rangle = 4\pi \left(\frac{\mu}{2\pi k_B T} \right)^{3/2} \int_0^\infty \sigma(v) v^3 \exp\left(-\frac{\mu v^2}{2k_B T}\right) dv$$

Cross sections determined quantum-mechanically or experimentally

EXPERIMENTAL/THEORETICAL PROBLEMS

- ▶ Generation of a gas at very low temperature without significant condensation or clustering
- ▶ Absolute concentration determination of species (often radicals with short lifetime)
- ▶ Theoretically is even more challenging: quantum mechanical dynamical calculations possible only for small systems... in addition at the low temperatures we have to consider tunneling effects, resonances, etc. etc.

MOLECULES FORMATION

TYPES OF GAS-PHASE CHEMICAL REACTIONS

Bond Formation Processes

Bond Destruction Processes

Bond Rearrangement Processes

TYPES OF GAS-PHASE CHEMICAL REACTIONS

Bond Formation Processes

Radiative association $X + Y \rightarrow XY + h\nu$

Associative detachment $X^- + Y \rightarrow XY + e^-$

TYPES OF GAS-PHASE CHEMICAL REACTIONS

Bond Formation Processes

Radiative association

Associative detachment

TYPES OF GAS-PHASE CHEMICAL REACTIONS

Bond Formation Processes

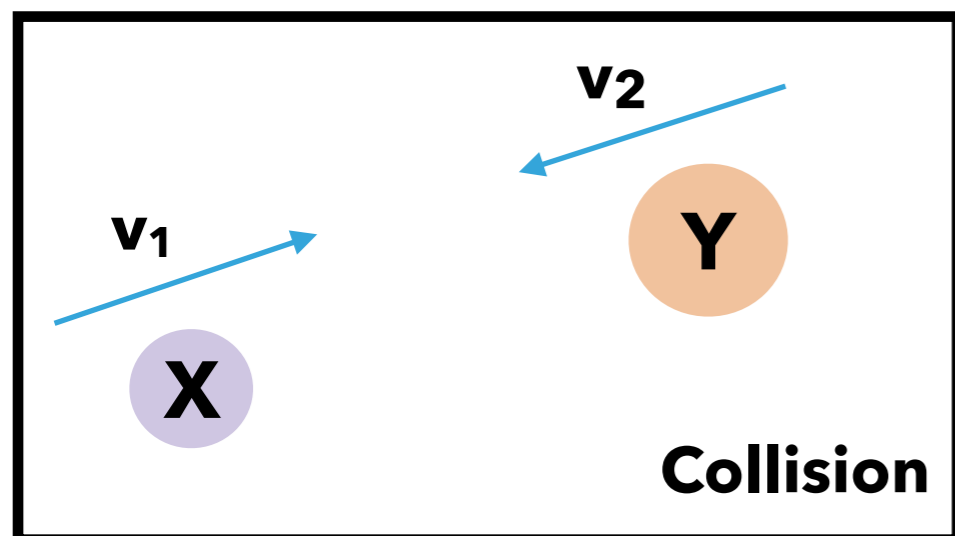

Radiative association

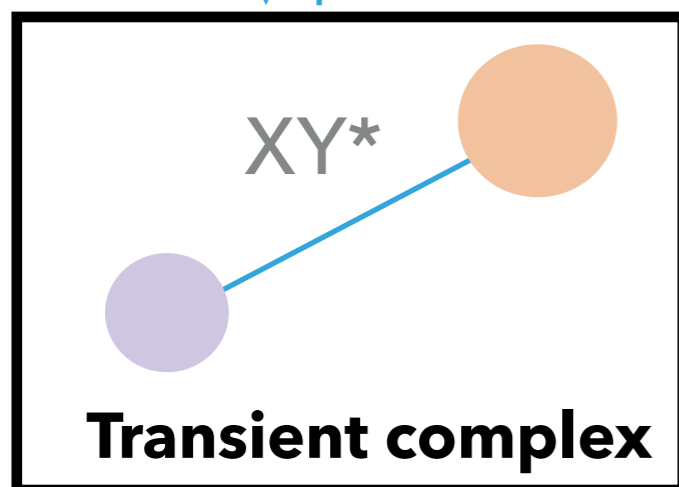

Associative detachment

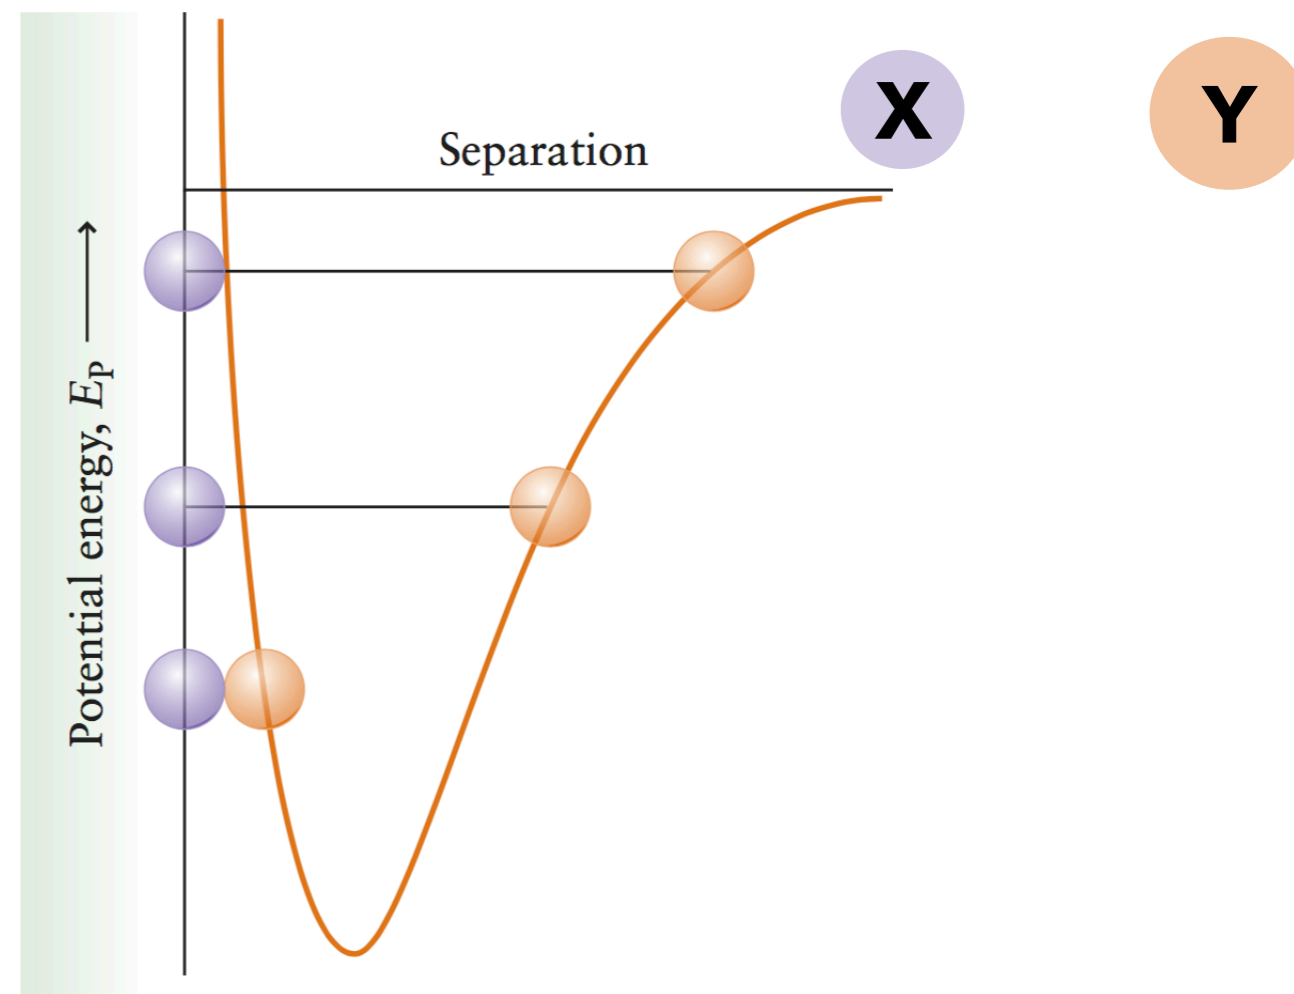

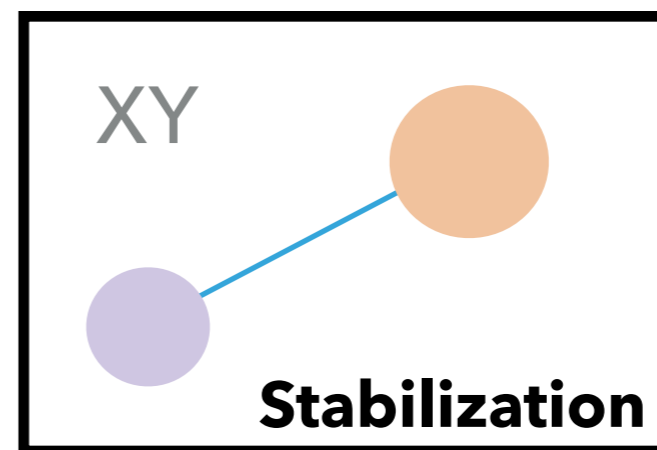

FORMATION OF BONDS

1 3

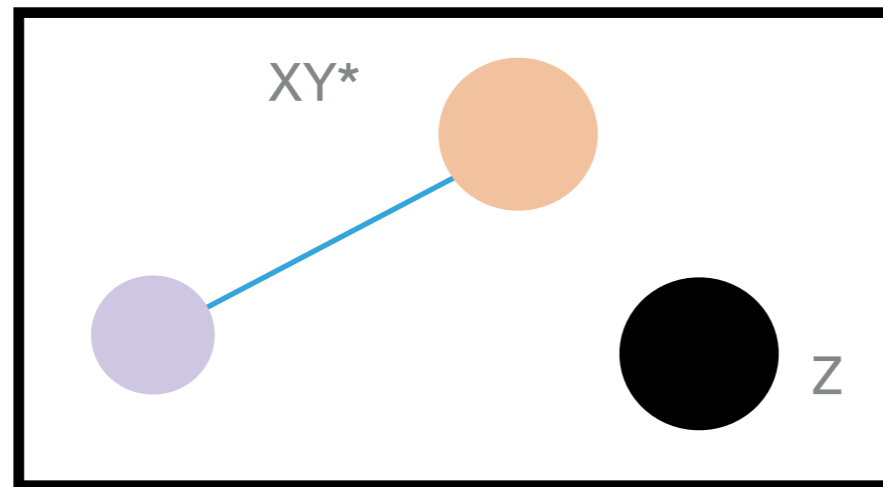

2

Formation of a transient complex that has to lose the excess of kinetic energy to stabilize the molecule

FORMATION OF BONDS

2

Normally done by a third body under Earth conditions

FORMATION OF BONDS: RADIATIVE ASSOCIATION

- ▶ In the ISM 3B collisions very rare (density is low)
- ▶ Formation of molecules can proceed through photon-emission

- ▶ The complex XY^* relaxes through the emission of radiation to yield a stable reaction product (2)
- ▶ Most probable scenario XY^* re-dissociates (3)

FORMATION OF BONDS: RADIATIVE ASSOCIATION

- ▶ Only long-lived activated complexes will lead to efficient radiative association reactions
- ▶ More energy levels available better the kinetic energy can be distributed

FORMATION OF BONDS: RADIATIVE ASSOCIATION

FORMATION OF BONDS: RADIATIVE ASSOCIATION

- ▶ The excess energy is distributed across electronic or vibrational states
- ▶ Via **vibrational** decay (radiative time: $A_{ul}^{-1} \sim 10^{-3}$ s)
- ▶ Collision time ($\sim 10^{-13}$ s with $v \sim 0.5$ km/s)
- ▶ (molecules form every $1:10^{10}$ collisions)

FORMATION OF BONDS: RADIATIVE ASSOCIATION

FORMATION OF BONDS: RADIATIVE ASSOCIATION

- ▶ Via **electronic** decay (lifetime: $A_{ul}^{-1} \sim 10^{-8}$ s)
- ▶ Collision time ($\sim 10^{-13}$ s)
- ▶ efficiency increased $1:10^5$ collisions

RADIATIVE ASSOCIATION: WHEN IS IT BOOSTED?

- ▶ If electronic states available
- ▶ Entrance channel has a barrier (dissociation longer)
- ▶ Molecules with large dipole moment faster $A_{ij} \propto \nu^3 |\mu_d|^2$
- ▶ Larger molecules, longer collision time

Reaction	k
$C + H \longrightarrow CH + h\nu$	1.0×10^{-17}
$C + C \longrightarrow C_2 + h\nu$	4.4×10^{-18}
$C + N \longrightarrow CN + h\nu$	1.4×10^{-18}
$C + H_2 \longrightarrow CH_2 + h\nu$	1.0×10^{-17}
$C^+ + H \longrightarrow CH^+ + h\nu$	1.7×10^{-17}
$C^+ + H_2 \longrightarrow CH_2^+ + h\nu$	4.0×10^{-16}
$O + O \longrightarrow O_2 + h\nu$	4.9×10^{-20}

RADIATIVE ASSOCIATION: WHERE WE GET THE RATES?

- ▶ Difficult to measure in laboratory as three-body collisions dominate under typical lab conditions
- ▶ Mostly based on theory with uncertainties of 1-2 orders of magnitudes

RADIATIVE ASSOCIATION: EXAMPLES

Well known R.A. rate, initiates the carbon chemistry: $\sim 10^{-15} \text{ cm}^3\text{s}^{-1}$

Larger molecules $\sim 10^{-11} \text{ cm}^3\text{s}^{-1}$:

RADIATIVE ATTACHMENT + ASSOCIATIVE DETACHMENT

Takes away the excess of energy

Example: radiative attachment followed by associative detachment

In general important if ionization fraction is high (early Universe!!)

ANIONS ARE RARE IN THE ISM

- ▶ In very dense environments excess of electrons can favor this process
- ▶ However the large densities will allow more collisions inducing the removal of all the electrons until **neutralization**
- ▶ In highly ionized environment photoionization will be dominant
- ▶ Polyatomic species that can stabilize the charge are more likely to be observed
- ▶ CN⁻ anion in the circumstellar envelope of IRC +10216 (Agundez et al., 2010).

TYPES OF GAS-PHASE CHEMICAL REACTIONS

Bond Formation Processes

Typical rate
coefficient ($\text{cm}^3 \text{s}^{-1}$)

Radiative association

$10^{-17} - 10^{-14}$

Associative detachment

$\sim 10^{-9}$

Bond Rearrangement Processes

Ion–molecule exchange

Charge–transfer

Neutral–neutral

REARRANGEMENT

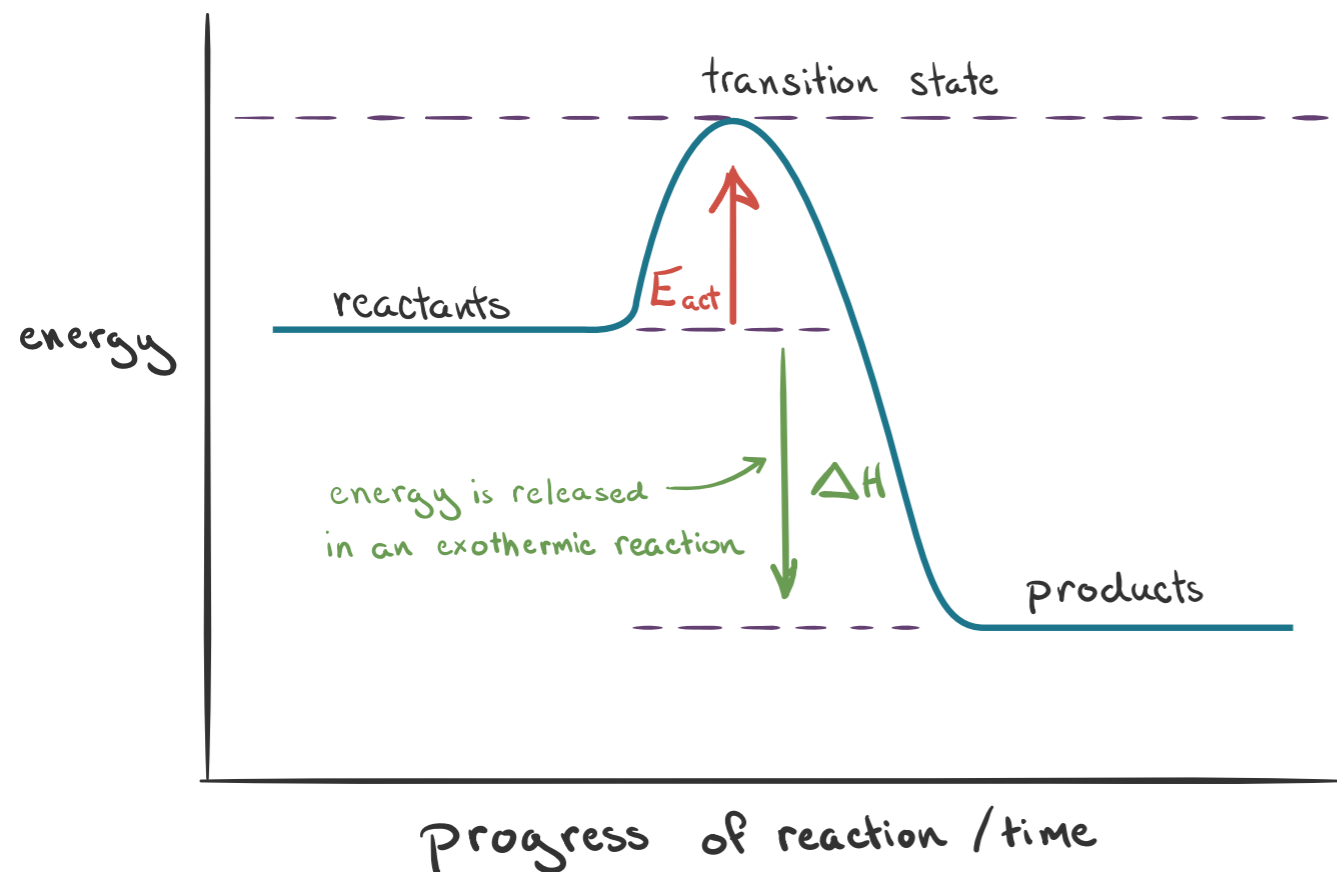

EXOTHERMIC AND ENDOTHERMIC

Bulk of molecules discovered in cold clouds ($T < 100$ K)

NEUTRAL-NEUTRAL REACTIONS

- ▶ Normal type of reaction on Earth atmosphere
- ▶ No attractive forces ("hard-spheres" models)

Interaction potential

$$V \sim r^{-6}$$

NEUTRAL-NEUTRAL REACTIONS: HARD-SPHERES

$$\sigma = \pi(r_A + r_B)^2$$

$$k = \sigma v_{AB} = \pi(r_A + r_B)^2 \left(\frac{8k_B T}{\pi \mu} \right)^{1/2}$$

NEUTRAL-NEUTRAL REACTIONS: HARD-SPHERES

$$k = \sigma v_{AB} = \pi(r_A + r_B)^2 \left(\frac{8k_B T}{\pi\mu} \right)^{1/2}$$

Calculate the rate at T = 10 K

$$\sigma = \pi(R_A + R_B)^2 \approx 10^{-15} \text{ cm}^2$$

$$\langle \sigma v \rangle = \pi(R_A + R_B)^2 \left(\frac{8k_B T}{\pi\mu_{AB}} \right)^{1/2} \approx 10^{-10} \left(\frac{T}{100 \text{ K}} \right)^{1/2} \text{ cm}^3 \text{ s}^{-1}$$

$$\mathbf{k \sim 10^{-11} - 10^{-13} \text{ cm}^3 \text{ s}^{-1}}$$

NEUTRAL-NEUTRAL REACTIONS: HARD-SPHERES

	$A(\text{cm}^3\text{s}^{-1})$	$E_a(\text{K})$
$\text{H} + \text{H}_2\text{CO} = \text{H}_2 + \text{HCO}$	$2.7 \cdot 10^{-11}$	1300
$\text{H} + \text{H}_2\text{S} = \text{H}_2 + \text{SH}$	$1.3 \cdot 10^{-11}$	860
$\text{H} + \text{O}_2 = \text{OH} + \text{O}$	$3.7 \cdot 10^{-10}$	8500
$\text{O} + \text{H}_2 = \text{OH} + \text{H}$	$1.0 \cdot 10^{-11}$	5700
$\text{O} + \text{H}_2\text{S} = \text{OH} + \text{SH}$	$6.6 \cdot 10^{-13}$	900
$\text{OH} + \text{CO} = \text{H} + \text{CO}_2$	$5.1 \cdot 10^{-13}$	300

$$k(T) = A(T) \exp\left(-\frac{E_a}{k_B T}\right)^{1/2}$$

NEUTRAL-NEUTRAL REACTIONS: HARD-SPHERES

A few exothermic, rare examples

NEUTRAL-NEUTRAL REACTIONS:

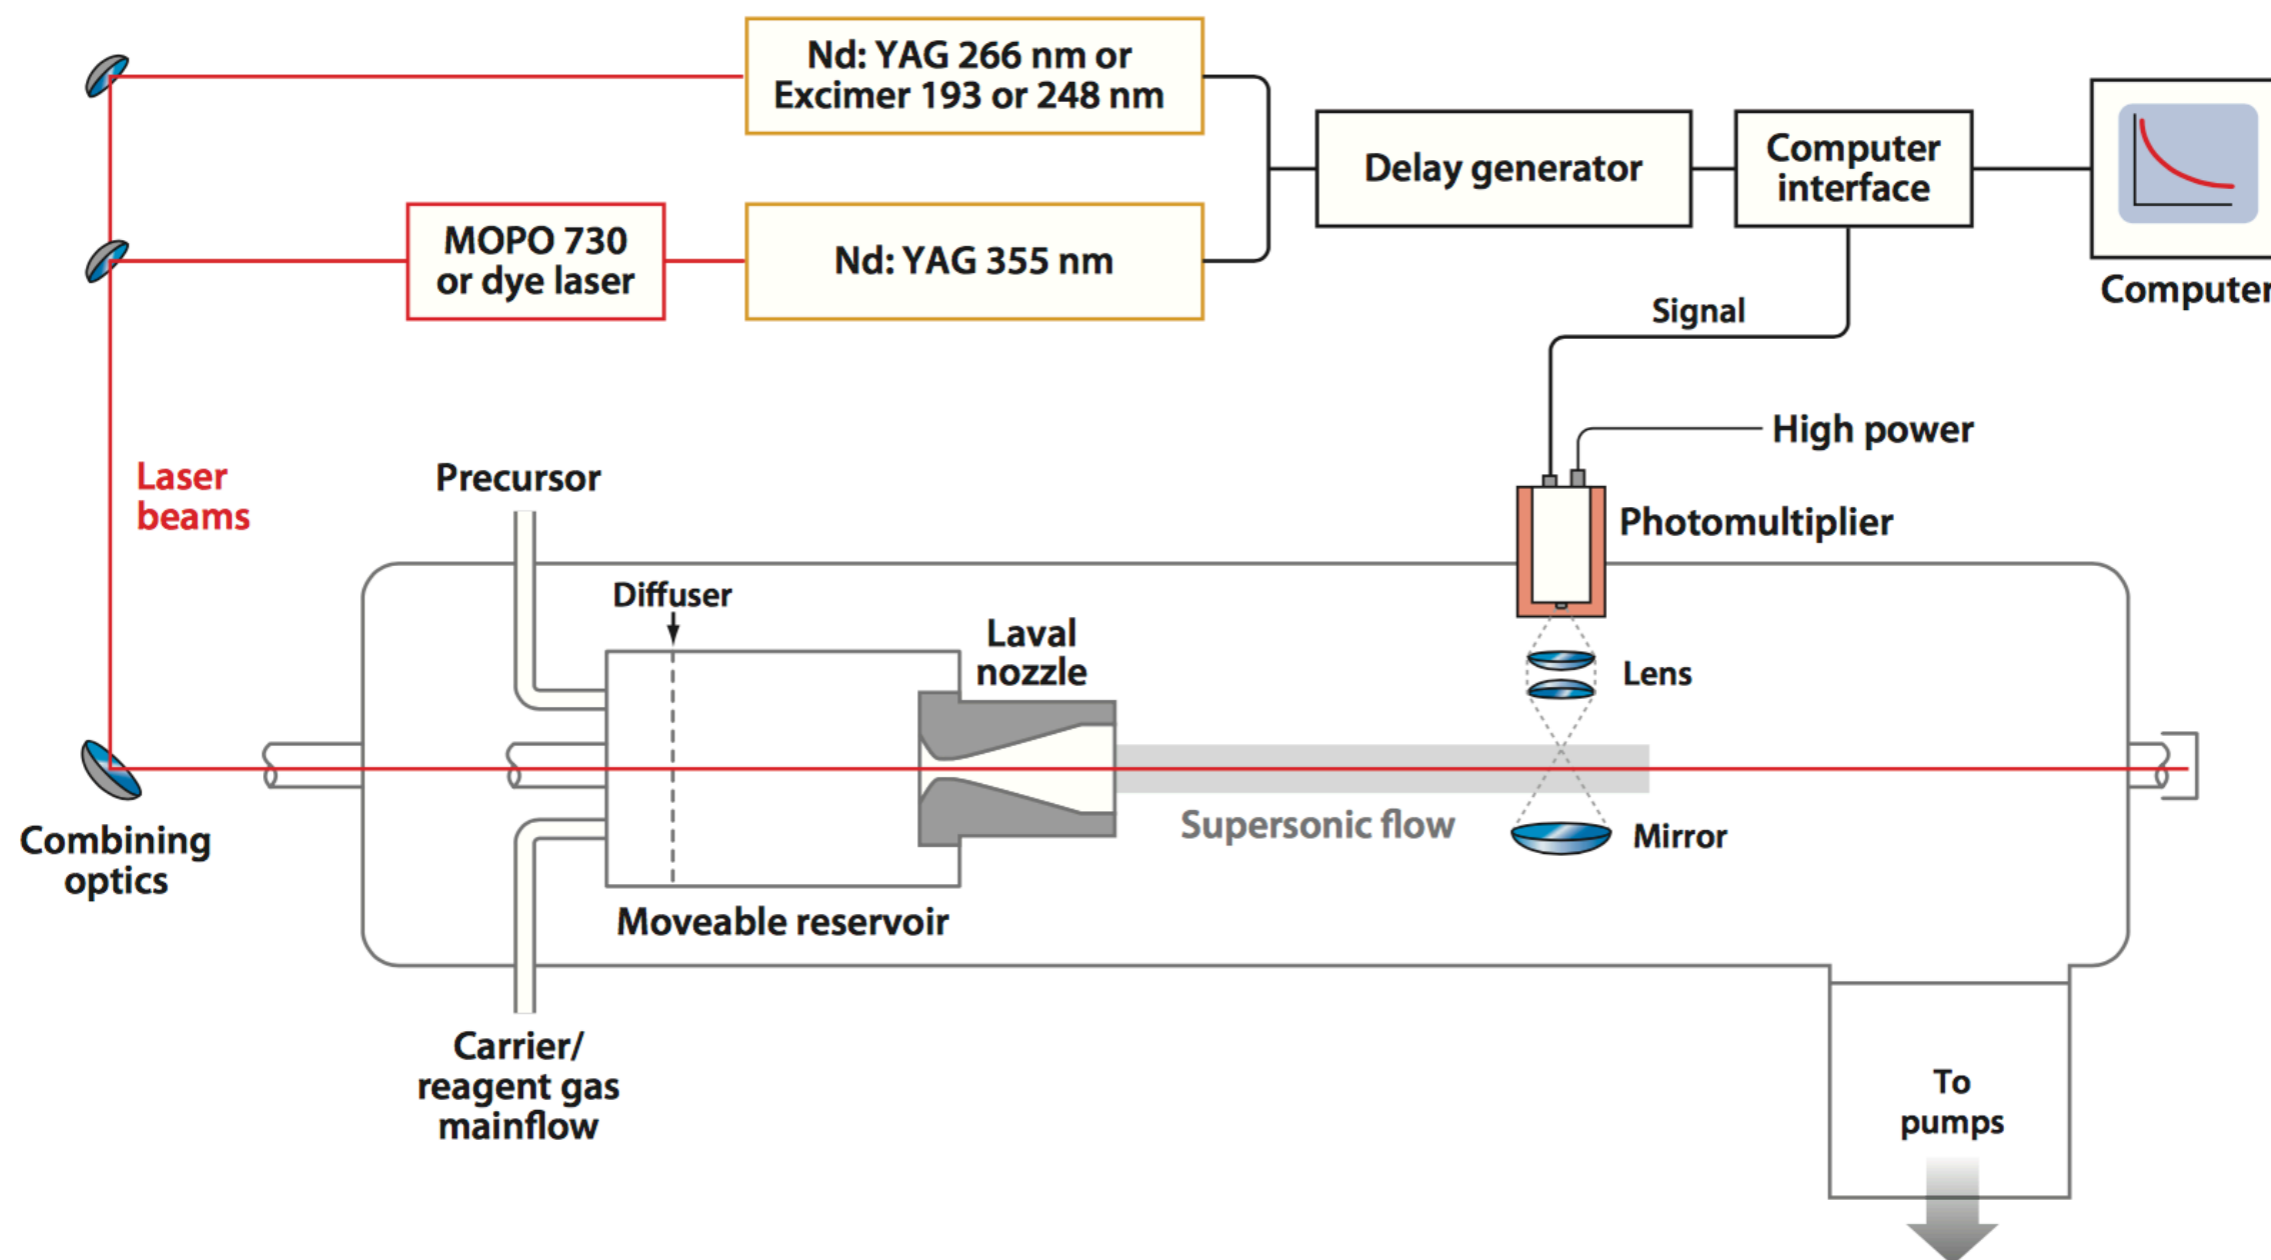

- ▶ Large activation energies
- ▶ neutral-neutral reactions involving atoms or radicals* can occur significantly because they have only small or no activation barriers
- ▶ Need high-T to overcome the barrier
- ▶ Important in shocks, outflows, stellar ejecta, hot cores...

*Radical: a chemical species with one unpaired electron, highly reactive, important examples in astrochemistry CH_3O , CH_3 , OH , CH ...

NEUTRAL-NEUTRAL REACTIONS: CRESU EXPERIMENT

Cinétique de Réaction en Ecoulement Supersonique Uniforme

Developed by Rowe 1985

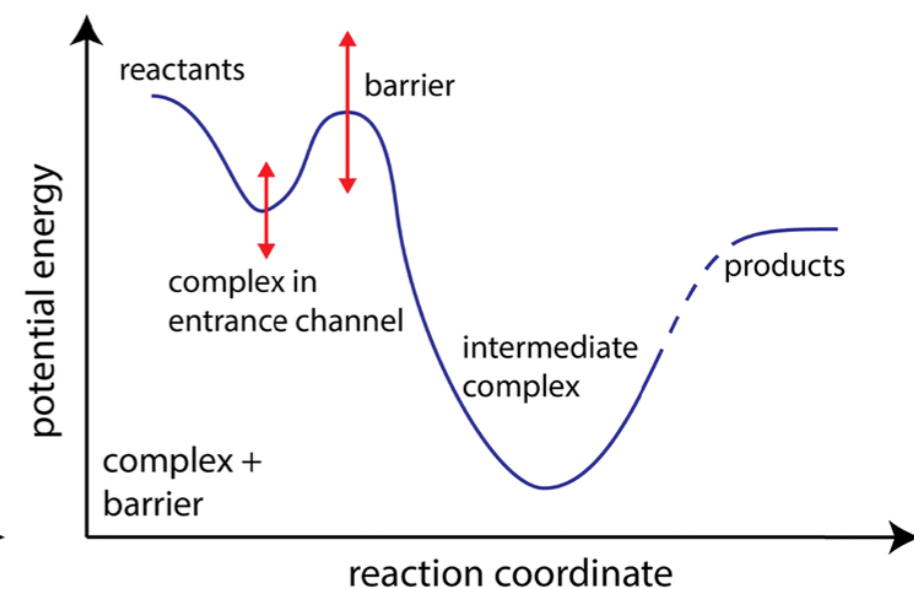

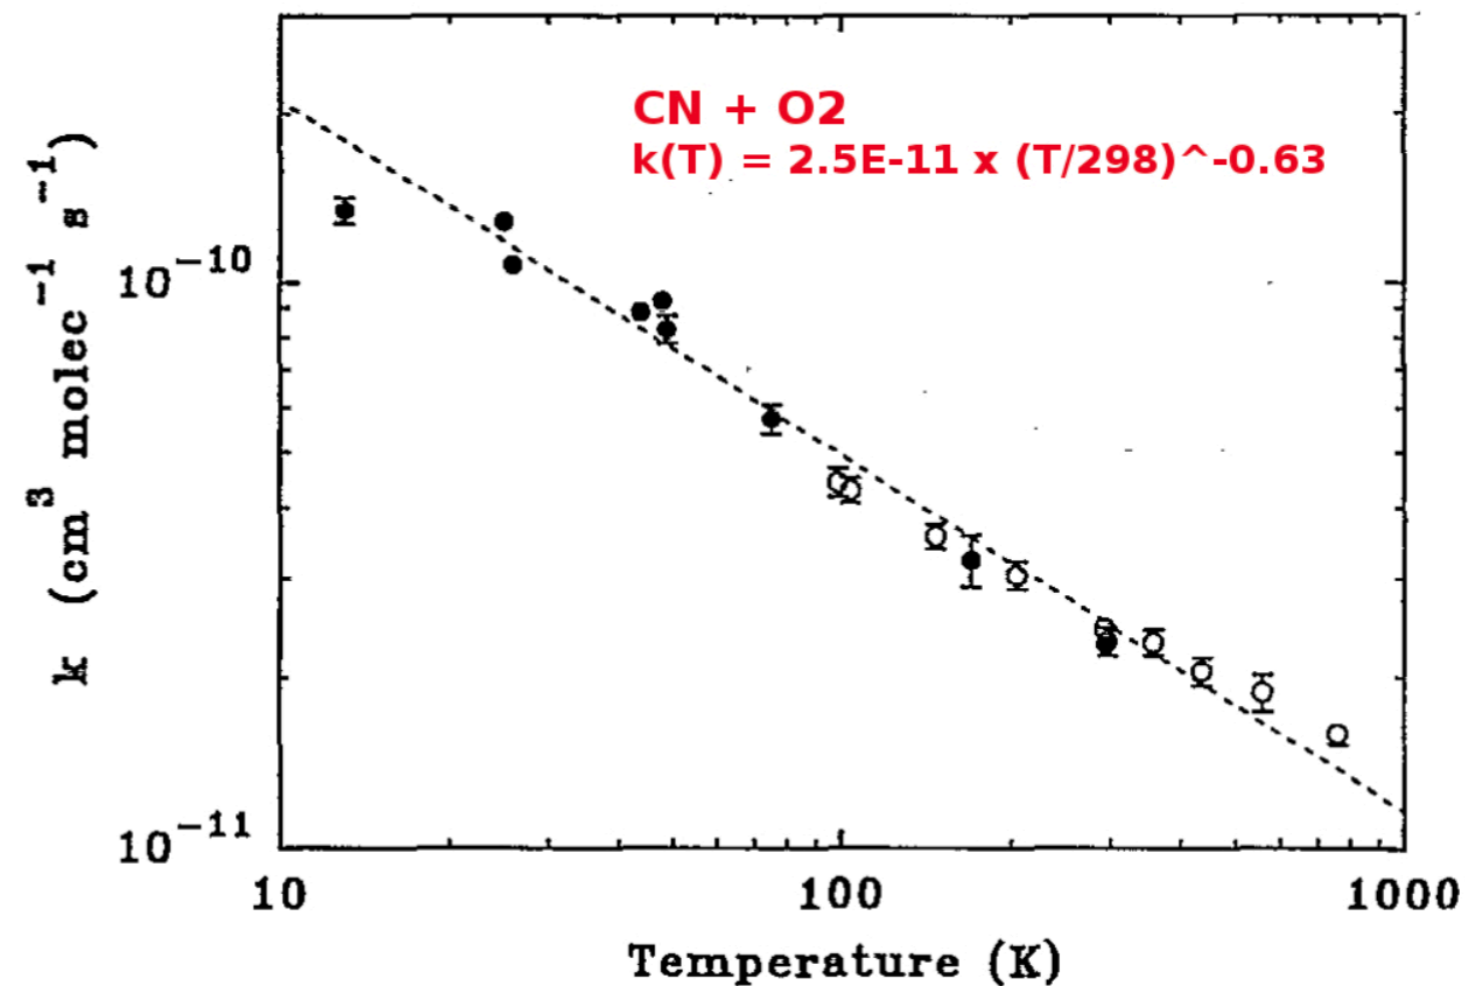

*flow of gas is produced: uniform in velocity, temperature (as low as 6 K), and density and persists for tens of centimeters

NEUTRAL-NEUTRAL REACTIONS: CRESU EXPERIMENT

Isentropic expansion

Sims I. R. et al, J Chem Phys 1994

NEUTRAL-NEUTRAL REACTIONS: THE NEW CRESUCHIRP

Each molecule has a unique microwave spectral fingerprint that can be detected by the chirped-pulse Fourier-transform microwave spectrometer within a single pulse (<https://cresuchirp.wordpress.com/research/>).

NEUTRAL-NEUTRAL REACTIONS: THE NEW CRESUCHIRP

TYPES OF GAS-PHASE CHEMICAL REACTIONS

Bond Formation Processes

Typical rate
coefficient ($\text{cm}^3 \text{s}^{-1}$)

Radiative association

$10^{-17} - 10^{-14}$

Associative detachment

$\sim 10^{-9}$

Bond Rearrangement Processes

Ion–molecule exchange

Charge–transfer

Neutral–neutral

$10^{-11} - 10^{-9}$

ION-NEUTRAL REACTIONS

$$AB + C^+ \rightarrow AC^+ + B$$

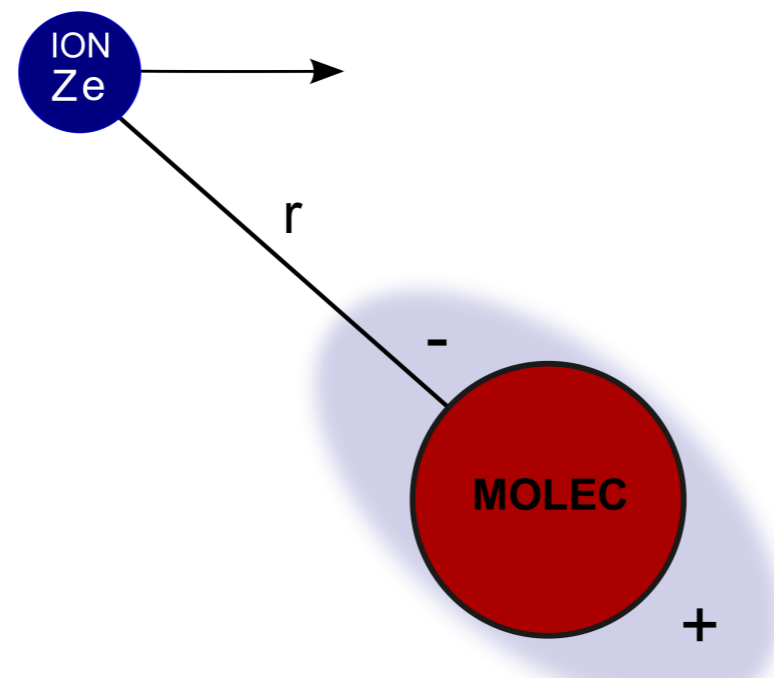

$$A^+ + B \rightarrow C^+ + D$$

dipole moment

$$\mu_D = \sum_i q_i \vec{r}_i$$

- 1. Polar molecules (e.g. water) have permanent dipole moment**
- 2. Charges can induce dipole moment in non-polar molecules**

ION-NEUTRAL INTERACTION

ION-NEUTRAL REACTIONS

$$\mu_D^{\text{induced}} = \alpha E$$

$$U(r) = -\frac{\alpha Z^2 e^2}{2r^4}$$

Long-range attractive potential

Polarizability indicates how easily the molecule electrons can be displaced by an electric field. Usually of the order of r_B^3

ION-NEUTRAL REACTIONS: CAPTURE THEORY

- ▶ Interaction between ion-neutral can be weak or strong
- ▶ Comparison between kinetic and interaction energy
- ▶ Angular momentum is conserved ($L = \mu b v$)
- ▶ Critical Impact parameter b_0

$$U(r) = -\frac{\alpha Z^2 e^2}{2r^4}$$

ION-NEUTRAL REACTIONS: CAPTURE THEORY

$$L = \mu v b$$

$b > b_0$ **No collisions: recoils**

$b < b_0$ **Reactive collisions**

$$U(r) = -\frac{\alpha Z^2 e^2}{2r^4} + \frac{\mu b^2 v^2}{2r^2}$$

Centrifugal force

ION-NEUTRAL REACTIONS: CAPTURE THEORY

$$b_0^2 = \sqrt{\frac{4\alpha e^2}{\mu v^2}}$$

$$k = \sigma v = \pi b_0^2 v = 2\pi e v \sqrt{\frac{\alpha}{\mu v^2}}$$

$$k = k_L = 2\pi e \sqrt{\frac{\alpha}{\mu}} \simeq 10^{-9} \text{ cm}^3 \text{ s}^{-1}$$

Langevin rate (1905)

ION-NEUTRAL REACTIONS: FINAL COMMENTS

- ▶ Generally more rapidly than neutral-neutral because of the strong polarization-induced interaction potential ($\sim r^{-4}$)
- ▶ A small amount of ions in a given medium can have a strong impact on the interstellar chemistry.
- ▶ If one of the two species has a permanent dipole moment the reactions are even faster
- ▶ $k \sim 10^{-9} \text{ cm}^3 \text{ s}^{-1}$

ION-NEUTRAL REACTIONS: DEVIATIONS FROM LANGEVIN

- ▶ So far we considered exothermic reactions (no barrier)
- ▶ If we have slightly endothermic or reactions with barrier there is a dependence on T
- ▶ Example $\text{N}^+ + \text{H}_2$ (decreases for $T < 100 \text{ K}$)

$$k(T) = k_L \exp\left(-\frac{E_a}{k_B T}\right)$$

ION-NEUTRAL REACTIONS: DEVIATIONS FROM LANGEVIN

$\text{NH}_3^+ + \text{H}_2$ exothermicity: 0.9 eV (with a small barrier)

- a “cornerstone” reaction in molecular clouds:
 H_2 ionized by photons, CRs, X-rays, reacts with ambient H_2

OXYGEN CHEMISTRY

CARBON-NITROGEN CHEMISTRY

ION-NEUTRAL REACTIONS: EXPERIMENTAL WORK

- ▶ Ion traps: observe the charge loss while the reactant is introduced ($n \sim 10^{11} \text{ cm}^{-3}$)
- ▶ Ion injected into a flowing gas and the loss is observed at a fixed point downstream when a neutral is added to the gas flow ($n \sim 10^{16} \text{ cm}^{-3}$)

ION-NEUTRAL REACTIONS: TRAPPING EXPERIMENT

22-Pole

Gerlich, Physica Scripta, T59, 256, (1995)

http://www.hkreckel.de/ion_trap.html

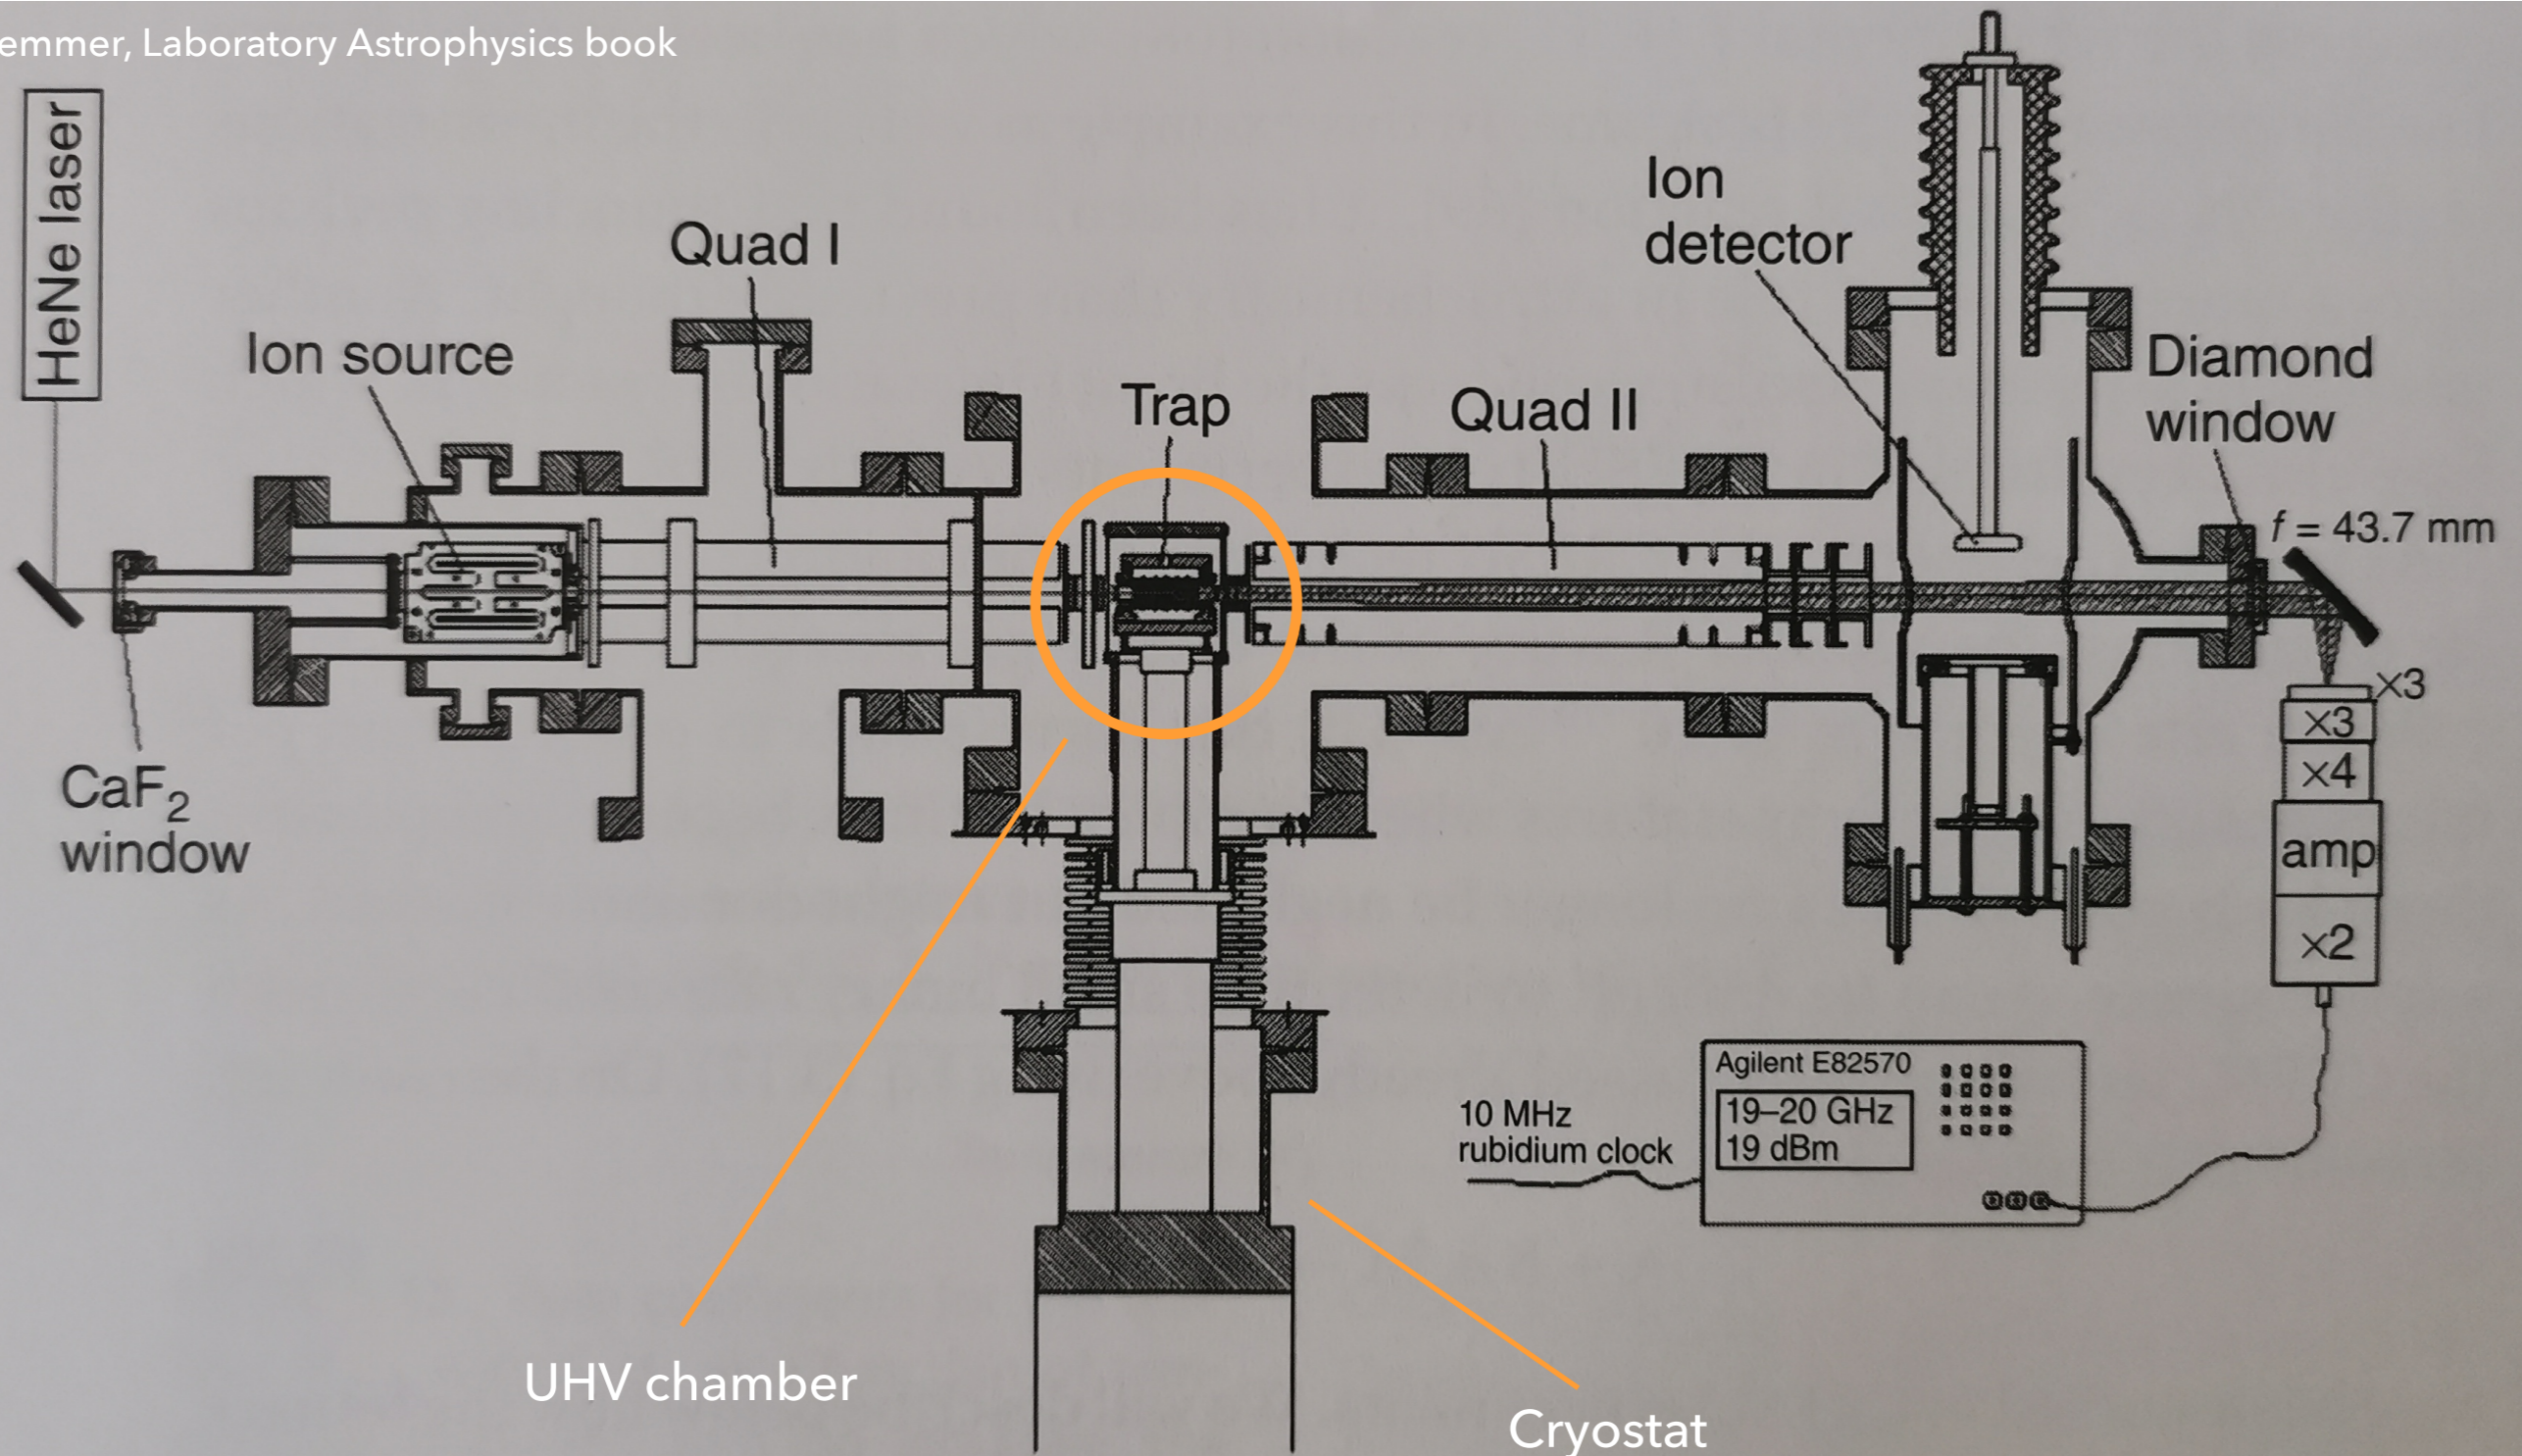

Neutral density: 10^9 - 10^{14} cm⁻³

Ion source: e.g. electron impact

Quadrupole mass filter: to select a certain m/z

Detector: to analyse the outcome of the reaction

Schlemmer, Laboratory Astrophysics book

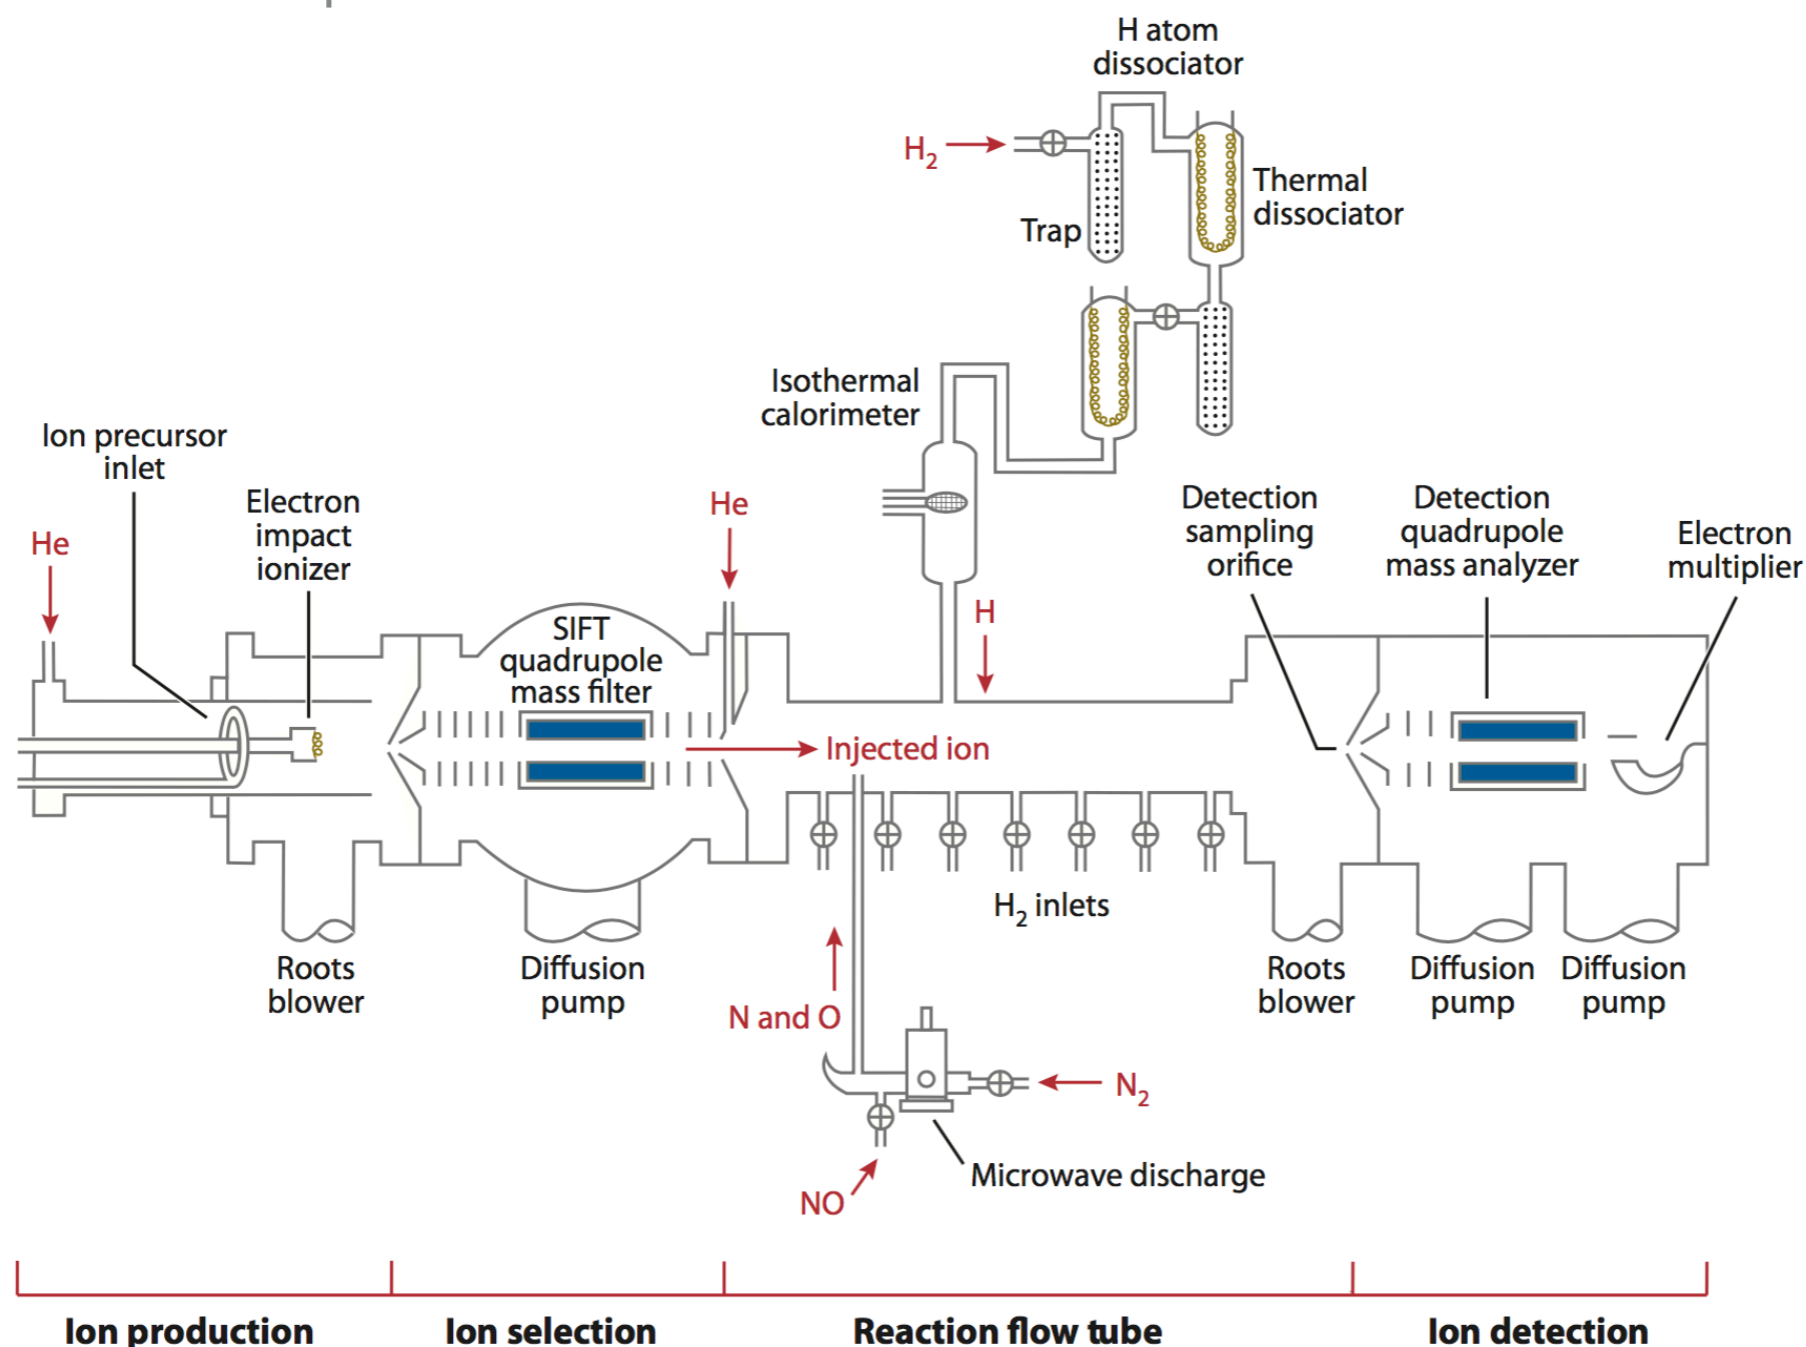

ION-NEUTRAL REACTIONS: EXPERIMENTAL WORK

- ▶ Flowing-afterglow (Ferguson et al. 1969):
- ▶ Ion produced at the upstream end of a tubular reactor (via discharge for N and O atoms or thermal dissociation for H)
- ▶ Diluted with a buffer gas (He), thermalization
- ▶ Neutrals introduced further away
- ▶ Mixture flows through mass spectrometric detection

ION-NEUTRAL REACTIONS: FA-SIFT EXPERIMENT

Working from room temperature down to 80 K max

ION-NEUTRAL REACTIONS: CHARGE TRANSFER

- ▶ In this reaction no break of chemical bonds
- ▶ Requires exothermicity
- ▶ Rate fast ($10^{-9} \text{ cm}^3 \text{ s}^{-1}$) and T-independent

Reaction	k
$H^+ + OH \rightarrow H + OH^+$	2.1×10^{-9}
$N_2^+ + H_2O \rightarrow N_2 + H_2O^+$	2.3×10^{-9}
$C^+ + CH \rightarrow C + CH^+$	3.8×10^{-10}
$C^+ + CH_2 \rightarrow C + CH_2^+$	5.2×10^{-10}
$C^+ + C_2H_4 \rightarrow C + C_2H_4^+$	3.0×10^{-10}
$N^+ + CH_2 \rightarrow N + CH_2^+$	1.0×10^{-9}
$O^+ + CH \rightarrow O + CH^+$	3.5×10^{-10}
$O^+ + H_2O \rightarrow O + H_2O^+$	3.2×10^{-9}

DESTRUCTION

RADIATIVE/DISSOCIATIVE RECOMBINATION

A reaction between an electron and an ion or molecular ion

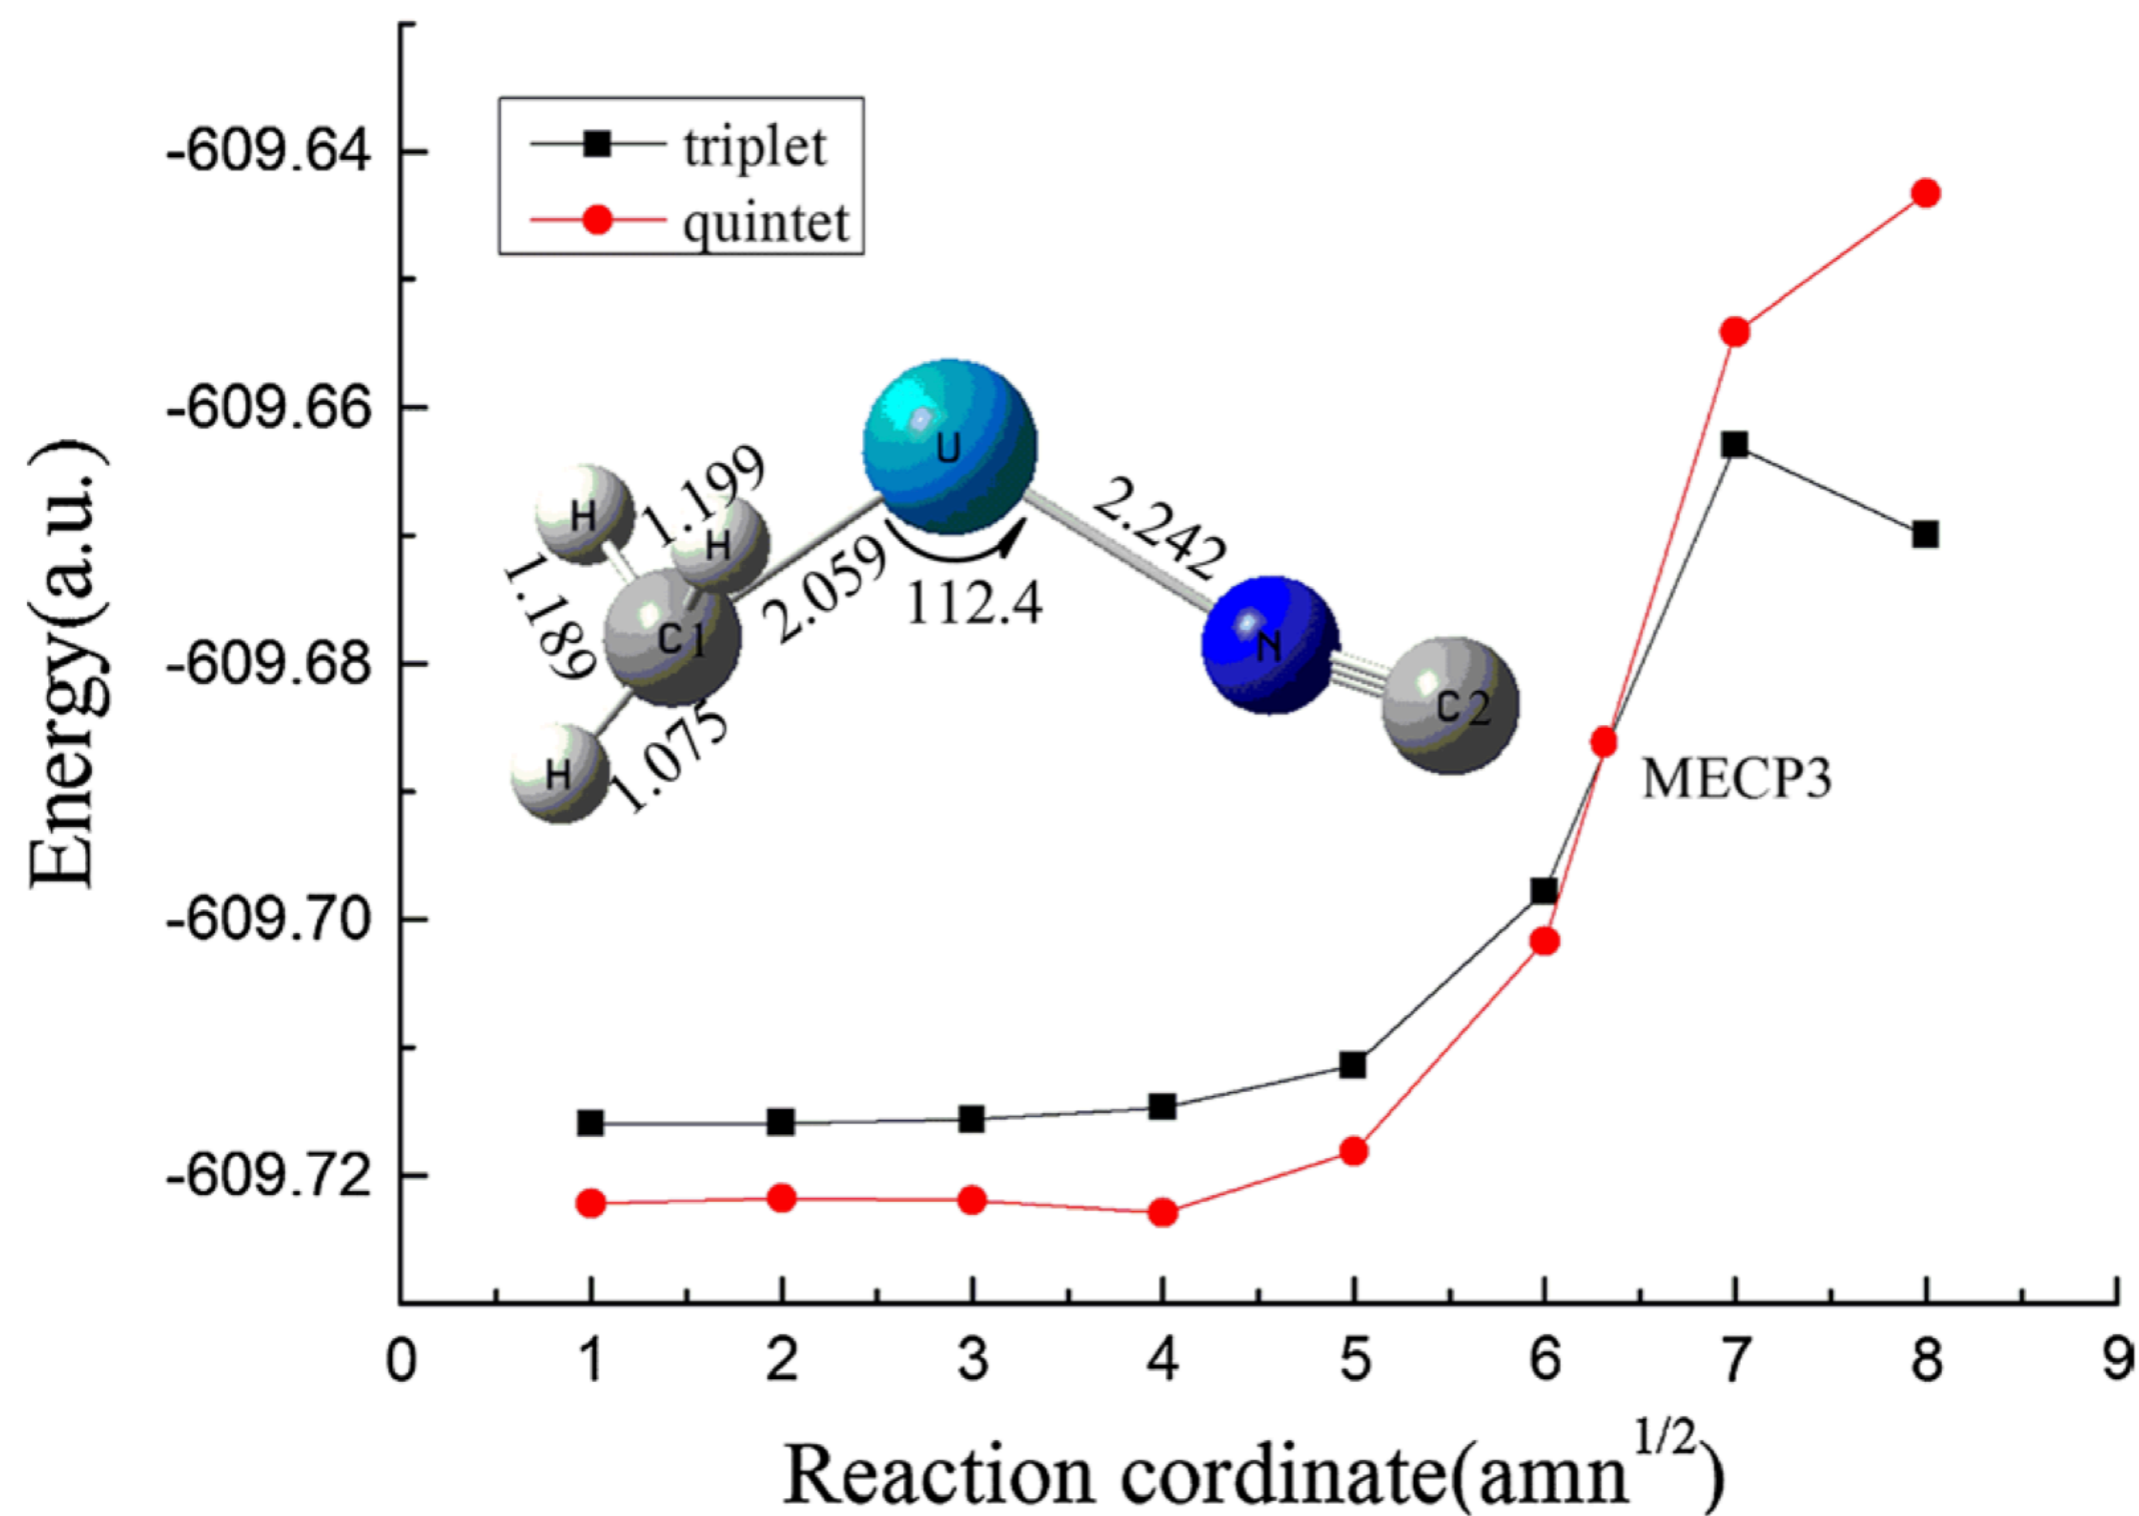

Major role is to create stable neutrals by dissociating molecular ions

RADIATIVE/DISSOCIATIVE RECOMBINATION

Electron excites transition of stable AB^+ ion to a repulsive state of AB molecule which crosses the energy curve of the ion AB^+ .

DISSOCIATIVE RECOMBINATION (CONT'D)

- ▶ Important source of neutral molecules
- ▶ Initiated by ions formed via ion-molecule reactions
- ▶ Very fast process: rates of the order of $10^{-7} \text{ cm}^3\text{s}^{-1}$ (@ 10 K)
- ▶ Usually rate goes as $T^{-1/2}$
- ▶ Difficult to measure/calculate, multiple products (need to know both the rate coefficient and the branching ratios)

DISSOCIATIVE RECOMBINATION: EXAMPLES

Branching ratios? Normally: same branching ratios assumed!

For this specific reaction Jensen+2000

BR major uncertainty!

DISSOCIATIVE RECOMBINATION (CONT'D)

Reaction	α	β
$\text{H}_2^+ + e^- \longrightarrow \text{H} + \text{H}$	1.6×10^{-8}	-0.43
$\text{H}_2\text{O}^+ + e^- \longrightarrow \text{O} + \text{H} + \text{H}$	3.1×10^{-7}	-0.5
$\text{H}_2\text{O}^+ + e^- \longrightarrow \text{OH} + \text{H}$	8.6×10^{-8}	-0.5
$\text{H}_3\text{O}^+ + e^- \longrightarrow \text{OH} + \text{H}_2$	6.0×10^{-8}	-0.5
$\text{H}_3\text{O}^+ + e^- \longrightarrow \text{O} + \text{H} + \text{H}_2$	5.6×10^{-9}	-0.5
$\text{H}_3^+ + e^- \longrightarrow \text{H}_2 + \text{H}$	2.3×10^{-8}	-0.52
$\text{HCN}^+ + e^- \longrightarrow \text{CN} + \text{H}$	2.0×10^{-7}	-0.5
$\text{HCO}^+ + e^- \longrightarrow \text{CO} + \text{H}$	2.4×10^{-7}	-0.69
$\text{HNO}^+ + e^- \longrightarrow \text{NO} + \text{H}$	3.0×10^{-7}	-0.69
$\text{C}_2^+ + e^- \longrightarrow \text{C} + \text{C}$	3.0×10^{-7}	-0.5
$\text{CH}^+ + e^- \longrightarrow \text{C} + \text{H}$	1.5×10^{-7}	-0.42
$\text{CH}_2^+ + e^- \longrightarrow \text{CH} + \text{H}$	1.4×10^{-7}	-0.55
$\text{CH}_2^+ + e^- \longrightarrow \text{C} + \text{H} + \text{H}$	4.0×10^{-7}	-0.6
$\text{CH}_3^+ + e^- \longrightarrow \text{CH} + \text{H} + \text{H}$	2.0×10^{-7}	-0.4
$\text{CH}_3^+ + e^- \longrightarrow \text{CH} + \text{H}_2$	2.0×10^{-7}	-0.5
$\text{CH}^+ + e^- \longrightarrow \text{C} + \text{H}$	1.5×10^{-7}	-0.42
$\text{CN}^+ + e^- \longrightarrow \text{C} + \text{N}$	1.8×10^{-7}	-0.5

DISSOCIATIVE RECOMBINATION: ION STORAGE RING

Length=40-60 m

Ion-beam velocities control

16 cryostat chambers

DISSOCIATIVE RECOMBINATION: EXAMPLE, H_3^+

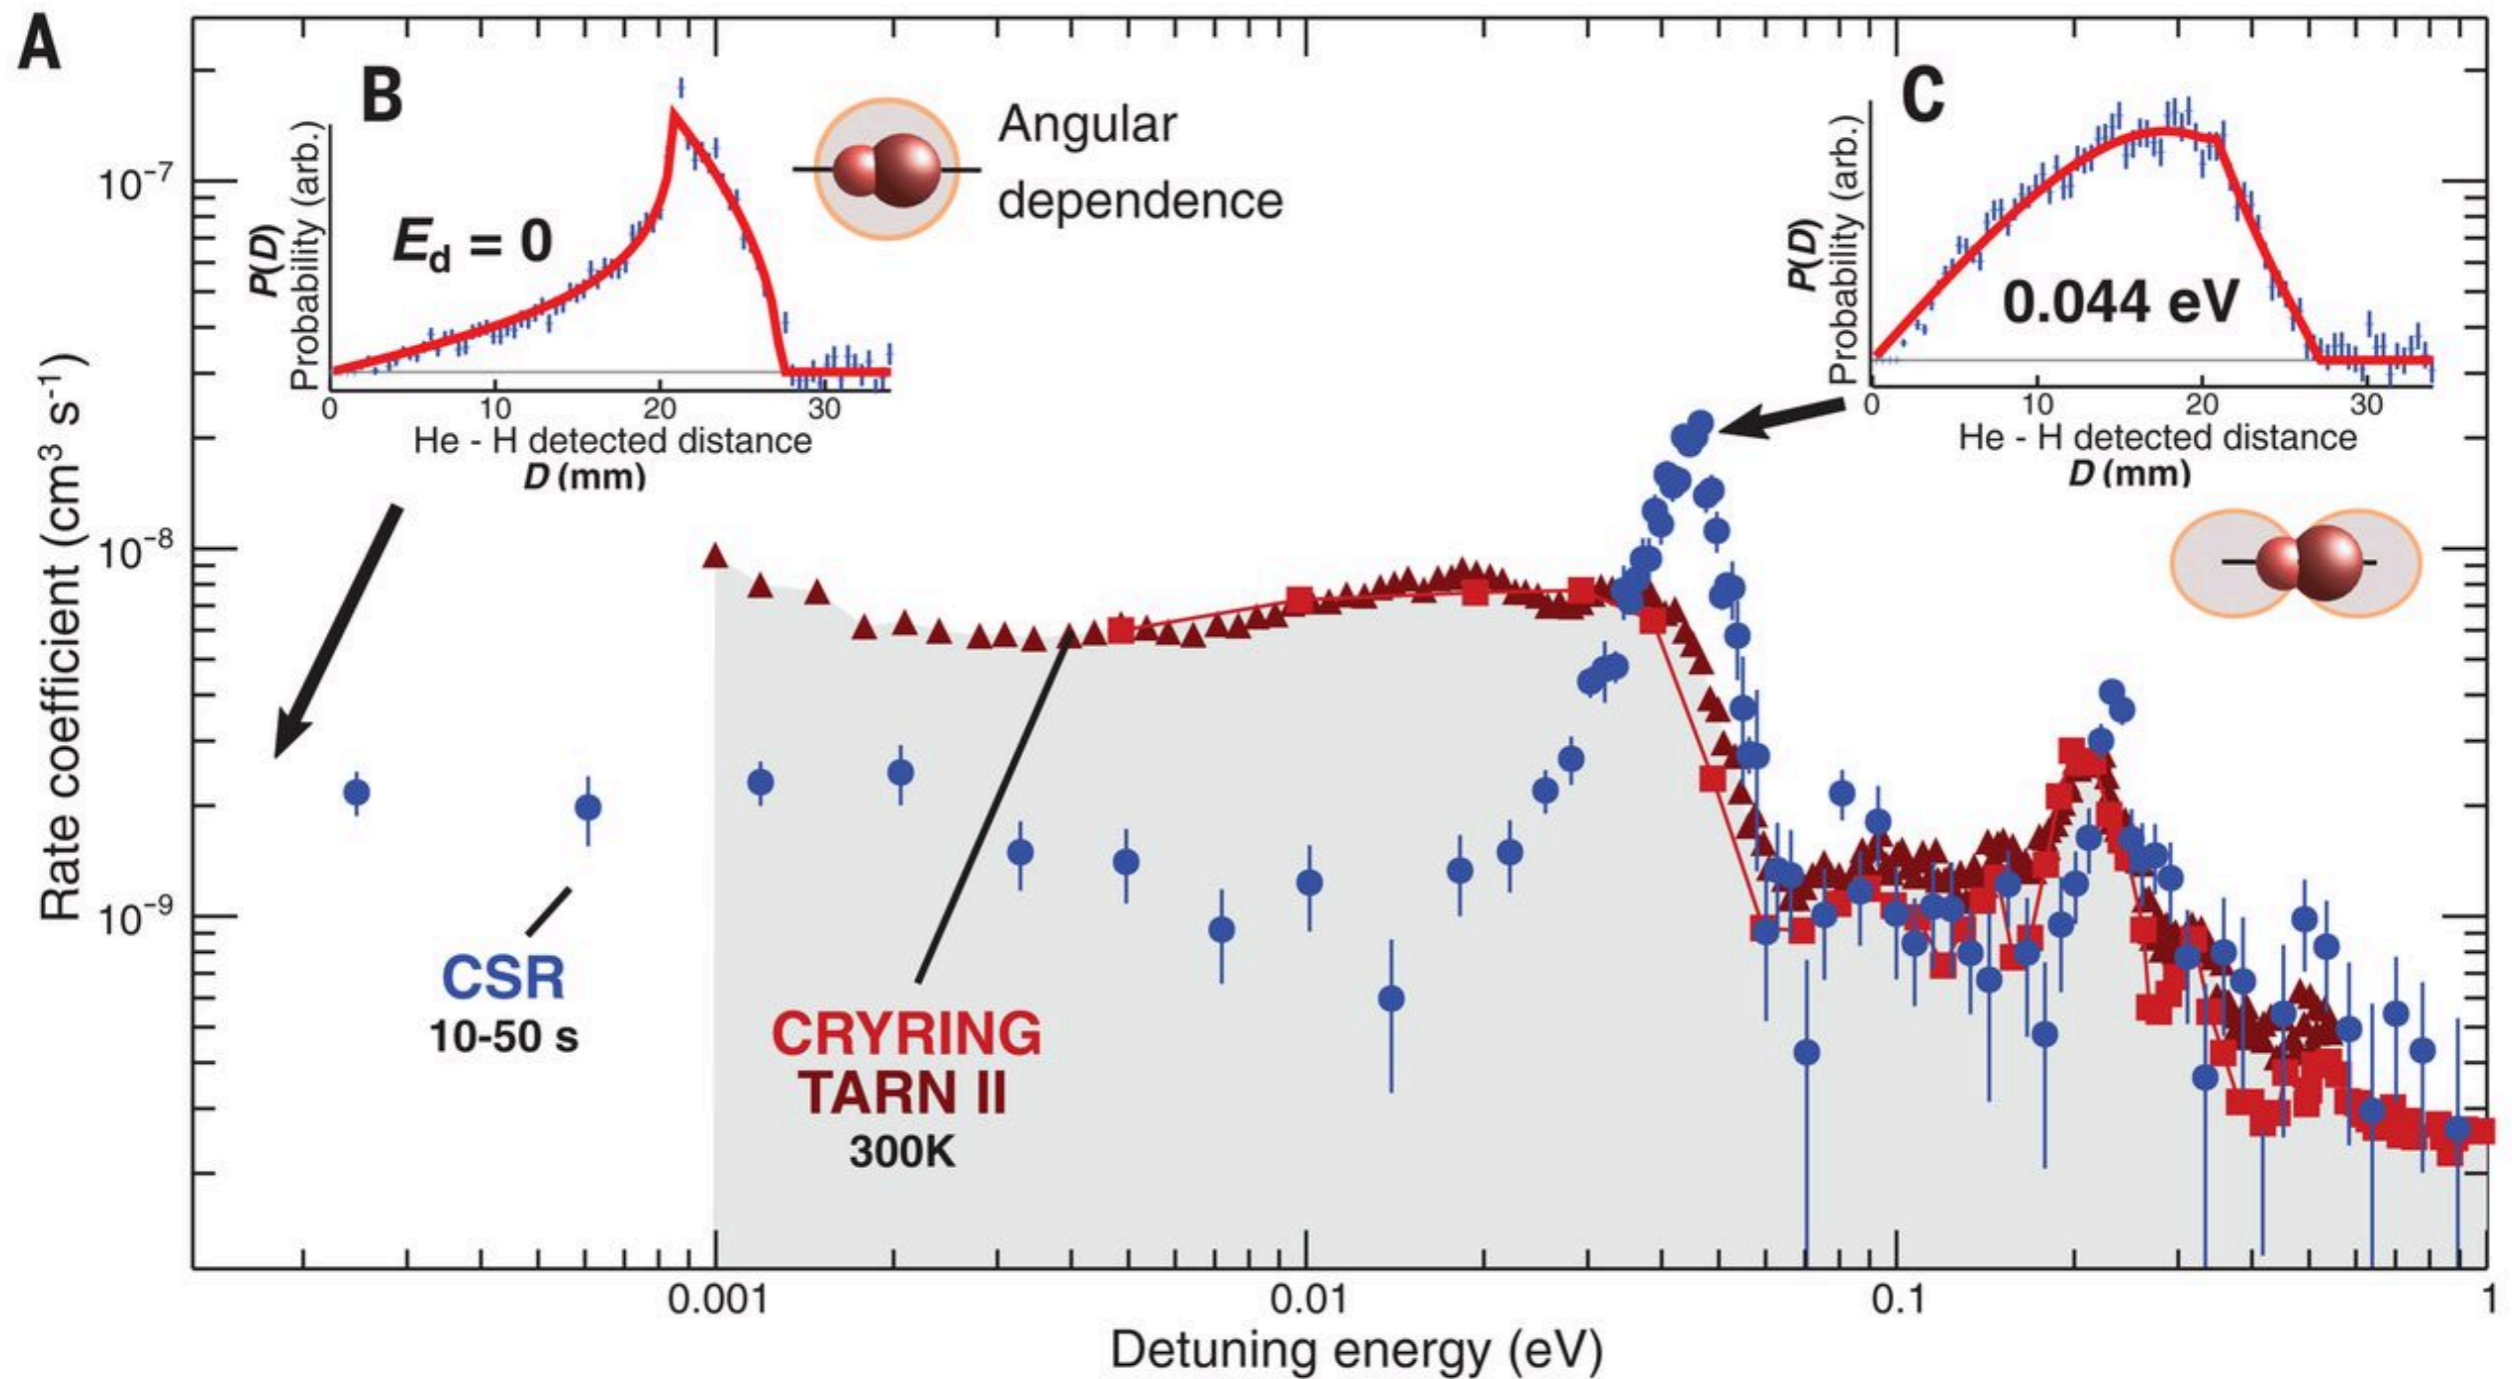

DISSOCIATIVE RECOMBINATION: CRYOGENIC ION STORAGE RING

CSR @ MAX PLANCK

DISSOCIATIVE RECOMBINATION: EXAMPLE, HeH^+

Early Universe, first molecules

Hydrogen recombination began after the generation of cosmic microwave background radiation.

Science

First molecule still animates astronomers

SUMMARY

- ▶ In general exothermic reactions are the most common
- ▶ Preferably with no barrier
- ▶ Shocks and turbulence can generate warm-zones where endothermic reactions can occur
- ▶ Ion-neutral reactions very important in cold environments (MCs)
- ▶ Radiative attachment/detachment in envs with high-ionization degree (ionized regions and early Universe)
- ▶ Dissociative recombination fundamental to create stable neutrals in cold regions

What do we miss?

- ▶ Photochemistry
- ▶ Cosmic-rays induced chemistry
- ▶ Gas-grain chemistry

Exercise

$x = \log(f_{\text{H}_2})$
 $y = \log(N[\text{ArH}^+]/N[\text{H}])$
